#### Intelligent Agents

Chapter 2

#### Outline

- ♦ Agents and environments
- ♦ Rationality
- ♦ PEAS (Performance measure, Environment, Actuators, Sensors)
- ♦ Environment types
- ♦ Agent types

#### Agents and environments

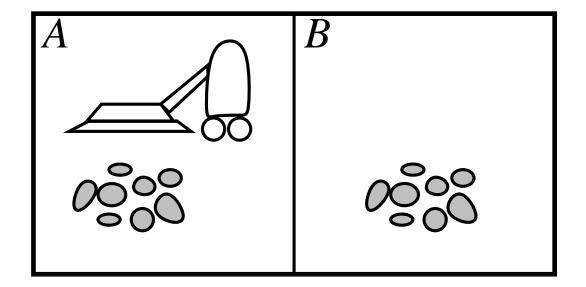

Agents include humans, robots, thermostats, etc.

The agent function maps from percept histories to actions:

$$f: \mathcal{P}^* \to \mathcal{A}$$

The agent program runs on the physical architecture to produce f

#### Vacuum-cleaner world

Percepts: location and contents, e.g., [A, Dirty]

Actions: Left, Right, Suck, NoOp

#### A vacuum-cleaner agent

Percept sequence	Action
[A, Clean]	Right
[A, Dirty]	Suck
[B, Clean]	Left
[B, Dirty]	Suck
[A, Clean], [A, Clean]	Right
[A, Clean], [A, Dirty]	Suck
:	<b>:</b>

```
function Reflex-Vacuum-Agent([location,status]) returns an action if status = Dirty then return Suck else if location = A then return Right else if location = B then return Left
```

What is the **right** function?

Can it be implemented in a small agent program?

#### Rationality

Fixed performance measure evaluates the environment sequence

- one point per square cleaned up in time T?
- one point per clean square per time step, minus one per move?
- penalize for > k dirty squares?

A rational agent chooses whichever action maximizes the expected value of the performance measure given the percept sequence to date

Rational  $\neq$  omniscient

percepts may not supply all relevant information

Rational  $\neq$  clairvoyant

- action outcomes may not be as expected

Hence, rational  $\neq$  successful

Rational  $\Rightarrow$  exploration, learning, autonomy

#### **PEAS**

To design a rational agent, we must specify the task environment

Consider, e.g., the task of designing an automated taxi:

Performance measure??

**Environment**??

Actuators??

Sensors??

#### **PEAS**

To design a rational agent, we must specify the task environment

Consider, e.g., the task of designing an automated taxi:

Performance measure?? safety, destination, profits, legality, comfort, . . .

**Environment??** US streets/freeways, traffic, pedestrians, weather, . . .

Actuators?? steering, accelerator, brake, horn, speaker/display, . . .

Sensors?? video, accelerometers, gauges, engine sensors, keyboard, GPS, . . .

# Internet shopping agent

Performance measure??

**Environment??** 

Actuators??

Sensors??

### Internet shopping agent

Performance measure?? price, quality, appropriateness, efficiency

**Environment??** current and future WWW sites, vendors, shippers

Actuators?? display to user, follow URL, fill in form

Sensors?? HTML pages (text, graphics, scripts)

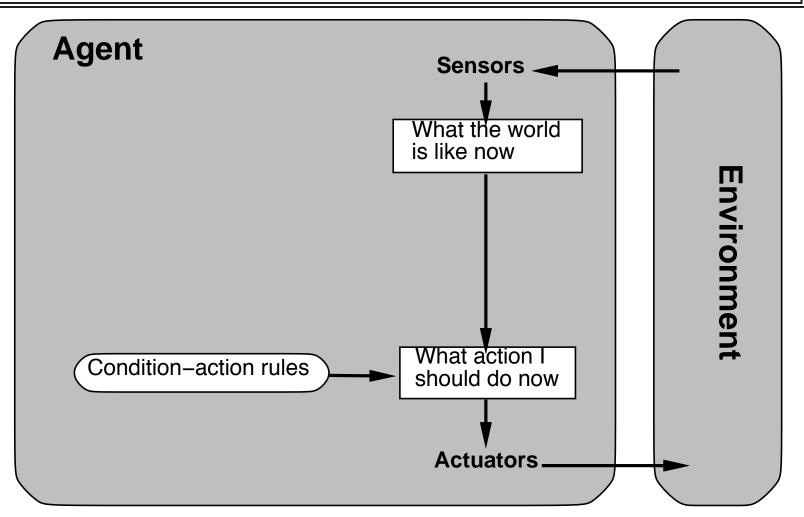

#### Agent types

Four basic types in order of increasing generality:

- simple reflex agents
- reflex agents with state
- goal-based agents
- utility-based agents

All these can be turned into learning agents

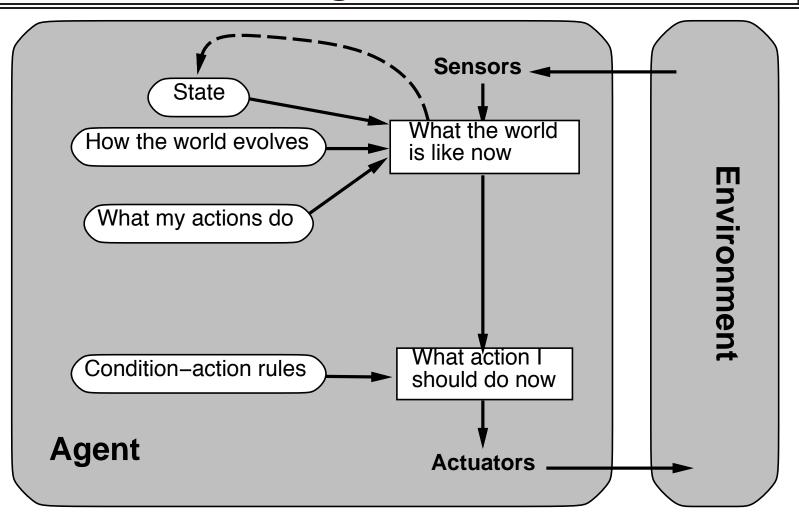

### Simple reflex agents

#### Example

```
function Reflex-Vacuum-Agent([location,status]) returns an action if status = Dirty then return Suck else if location = A then return Right else if location = B then return Left
```

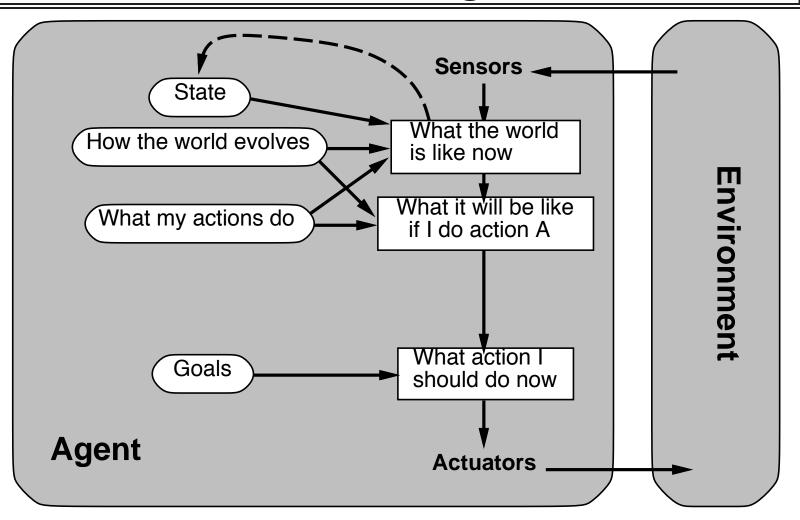

### Reflex agents with state

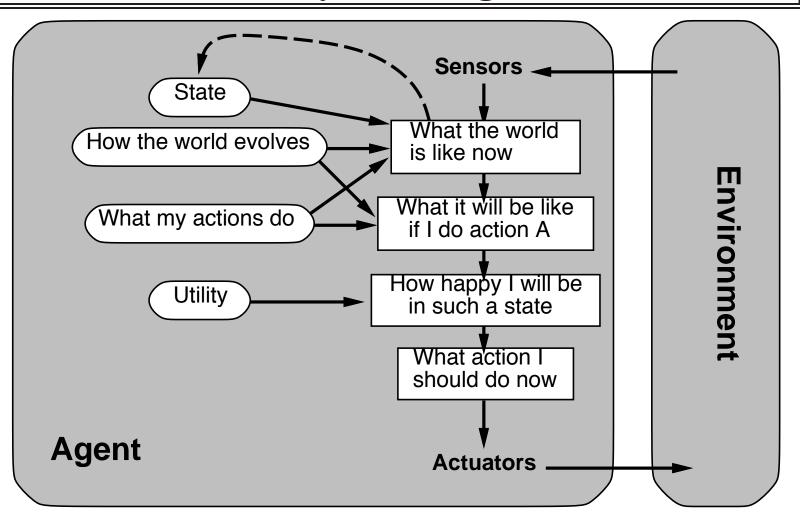

### Example

```
function Reflex-Vacuum-Agent ([location, status]) returns an action static: last\_A, last\_B, numbers, initially \infty
if status = Dirty then ...
```

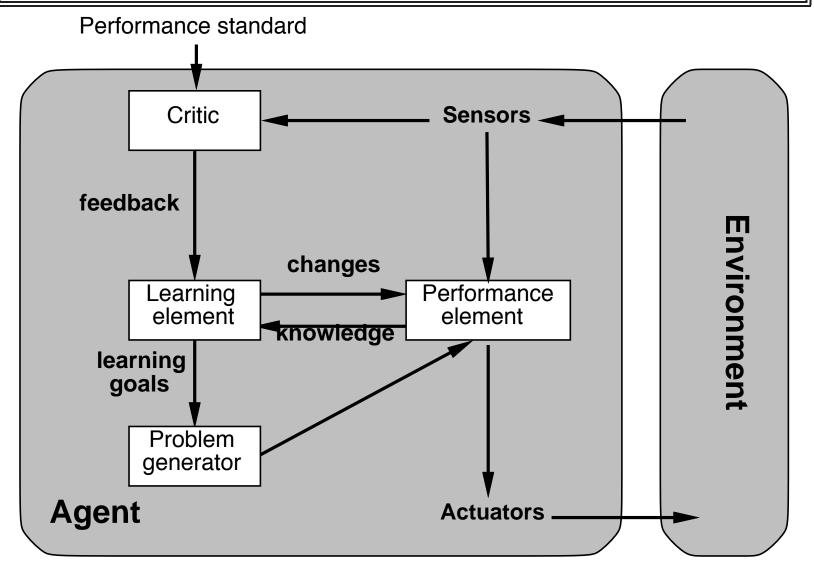

#### Goal-based agents

#### Utility-based agents

## Learning agents

#### Summary

Agents interact with environments through actuators and sensors

The agent function describes what the agent does in all circumstances

The performance measure evaluates the environment sequence

A perfectly rational agent maximizes expected performance

Agent programs implement (some) agent functions

PEAS descriptions define task environments

Environments are categorized along several dimensions: observable? deterministic? static? discrete? single-agent?

Several basic agent architectures exist: reflex, reflex with state, goal-based, utility-based

## End of Chapter 2

Thanks & Questions!
